Better Anesthesia with **digiCloud™**

SedVUE™

SedVUE is the anesthesia reporting module of digiCloud. SedVUE features include the ability to collect all patient information, surgery assessments, surgery notes, patient vitals, and surgery drugs. All this can be entered and monitored in real time from any iPad, PC, Mac, or Android.

Complete Records

After the completion of a surgery all patient data entered/collected for a procedure is automatically saved inside digiCloud's patient database. From here all records will be stored safely and can be reviewed at anytime or downloaded in PDF format.

No Software Installation

Being a fully cloud-based application means there is no software to install or data to manage. It's all managed for you and updated seamlessly on the cloud.

Staff Permission

Account admin users are able to control permission levels of individual staff members. With this staff member will only be able to access and change what you allow them too.

Never Lose Data

Patient vitals data is always backed up on the device for added safety. Interruptions in data transmission with digiCloud will not result in data loss.
